Tackling the Dueling-Platforms Dilemma: Recommendations for Community Information Exchange

It looks like you're trying to solve intractable human problems with technology .

The Problem

People's needs are complex and variable.
Organizations too.

One piece of software cannot solve
everyone's problems.

A LANDSCAPE OF SILOS: CHAOTIC, WASTEFUL, INEFFECTIVE

PEOPLE IN NEED

Poor families with children
People with disabilities
Veterans
Elders
Etc.

Counseling

As a result of the technology-first approach to problem-solving:

MORE silos:

every attempt to build the “one system for all” competes with others.

Immature markets:

every effort has to start from scratch.

Consolidation:

early winners become monopolies, then become unresponsive/extractive.

Lack of accountability:

as vendors consolidate power, communities lose power

The Vision

A healthy information **ecosystem**
in which data can be **effectively** and **ethically** shared across
many contexts using ***many technologies.***

A HEALTHY ECOSYSTEM: ACCESSIBLE, INTEROPERABLE, ACCOUNTABLE

PEOPLE IN NEED

Poor families with children
People with disabilities
Veterans
Elders
Etc.

CORE FUNCTIONS OF A “COMMUNITY INFORMATION EXCHANGE”

Resource Data Exchange:

facilitate flow of info about health/human/social *services*.

Client Data Exchange:

facilitate flow of info about *people* shared among services.

Different problems!

Different protocols!

Different infrastructures!

Different governance strategies!

Ecosystem Strategy:

Protocols to establish interoperability.

Infrastructure to establish common functionality.

Governance to ensure accountability and equitability.

PROTOCOLS:

What are protocols? Specific ways of doing things

Why does it matter? Protocols create interoperability. Different technologies can 'speak' to each other.

What are some examples? HTTP (TCP/IP); SMS; HSDS

UNSOLVED (UNSOLVABLE?) PROBLEMS:

Interoperability:

Syntactic vs Semantic

structure | meaning

mechanical | social/cultural

data portability | taxonomies/ontologies

Solvable problem! | We can cope with it?

INFRASTRUCTURE:

What is infrastructure? Systems that undergird and enable other systems.

What are some examples? Highways. Power. USPS. 2-1-1 San Diego's Community Information Exchange. Health Information Exchanges.

Can be **centralized** (one-to-many), **distributed** (many-to-many), or **federated** (hybrid)

UNSOLVED (UNSOLVABLE?) PROBLEMS:

Infrastructure is relational.

It isn't a thing.

It is a set of relationships between things, people, protocols, and institutions.

Hard to 'see,' hard to measure,
hard to monetize.

Markets tend to fail to provide it.

GOVERNANCE

The **alignment of diverse interests**
in **the process of making and enforcing decisions**
about the **allocation and use of resources.**

The Core Questions of Governance

1. Whose needs matter? Who benefits from what?
2. What CAN, MUST or MUST NOT happen?
3. What happens when something goes wrong?
4. Who decides? Who decides who decides?

CORE FUNCTIONS OF A “COMMUNITY INFORMATION EXCHANGE”

Resource Data Exchange:

facilitate flow of info about health/human/social *services*.

Client Data Exchange:

facilitate flow of info about *people* shared among services.

Different problems!

Different protocols!

Different infrastructures!

Different governance strategies!

Resource Data Exchange:

Protocols:

Human Service Data
Specs and APIs (HSDS/A)

Infrastructure:

“Open211”
(centralized data utility)

Benetech ServiceNet
(federated data management)

Governance:

Service registers?
Data trusts?

A HEALTHY ECOSYSTEM: ACCESSIBLE, INTEROPERABLE, SUSTAINABLE

What Should We Do?

1. Invest in PEOPLE and PROCESSES first.
2. Require interop (standards) and oversight (governance) as contracting conditions.
3. Experiment, learn, repeat.

*Thanks for listening.
Let's talk.*
